

NDIR GAS ANALYZER (HIGH PERFORMANCE MODEL)

DATA SHEET

ZPB

This gas analyzer (ZPB) is capable of measuring the concentration of NO, SO_2 , CO_2 , CO and O_2 components in sample gas. NO, SO_2 , CO_2 , CO are measured by non-dispersion infrared method (NDIR), while O_2 is measured by fuel cell or paramagnetic and zirconia method.

Through use of the sample switching system, ZPB is capable of canceling drift in the zero point of the measurable component by NDIR.

Optimum use as an analyzer unit of a measurement system for combustion exhaust gas from refuse incinerators and boilers, or gas from various industrial furnaces.

FEATURES

1. High sensitivity

Equipped with the newest upgraded mass flow sensor. Capable of 0-50ppm measuring range with a newly designed measurement unit.

2. Excellent stability

Due to adoption of sample switching method (note1). It is capable of canceling drift in the zero point of measurable component.

3. Easy maintenance

Single beam design simplifies maintenance and minimizes maintenance costs compared with double beam or similarly equipper GFC based system.

4. Small and light

The size is small 133x483x382mm (HxWxD) and light (13kg). The unit is capable of measuring up to 5 gas components in one analyzer.

5. Extensive functions

Various optional functions are available such as auto calibration control, atmospheric pressure correction, high and low concentration alarms, remote range switch, and range identification signal, etc.

note1) Excellent long term stability due to sample gas and reference gas flowed alternately to the measurement unit.

SPECIFICATIONS

Standard Specifications

Principle of measurement:

NO, SO₂, CO₂, CO;

Non-dispersion infrared-ray absorption method (NDIR method)

Single light source and single beams (single beam system)

O₂ ;Fuel cell O₂ analyzer (built in) or paramagnetic O₂ analyzer (built-in) or zirconia O₂ analyzer (externally installed TYPE: ZFK7)

Measurable gas components and measuring range:

	Minimum range	Maximum range
NO	0 - 50ppm	0 - 5000ppm
SO ₂	0 - 50ppm	0 - 5000ppm
CO ₂	0 - 50ppm	0 - 25vol%
СО	0 - 50ppm	0 - 5000ppm
O ₂ (built in fuel cell)	0 - 10vol%	0 - 25vol%
O ₂ (built-in Paramagnetic)	0 - 5vol%	0 - 100vol%
O ₂ (External) Zirconia	0 - 5vol%	0 - 25vol%

- Max. 5 components measurement including O₂.
- Measuring range ratio max. 1:10 (except O₂)
- Measuring ranges are changeable between the specified minimum and maximum range

Settable one range or two ranges

- * In measurement range, low range is called first range, high range is called second range.
- For possible combinations of components and ranges, refer to Table 1.

Measured value indication:

Digital indication in 4 digits (LCD panel with LED back light)

- · Instantaneous value of each component
- Instantaneous value after O₂ correction (only in NO, SO₂, CO measurement with O₂)
- Average value after O₂ correction (only in NO, SO₂, CO measurement with O₂)
- O₂ average value

Analog output signals:

4 to 20mA DC or 0 to 1V DC,

isolated internally from circuit and ground. Output lines are non-isolated each other.; 12 outputs max.

Allowable load 550Ω for 4 to 20mA DC Allowable load 100kΩ for 0 to 1V DC

* Refer to Table2 for the channel No. of displayed values and analog output

Analog input signal:

For signal input from externally installed O2 analyzer.

Signal requirement;

(1) Signal from Fuji's Zirconia O2 ana-(TYPE: ZFK7)

(2) 0 to 1V DC from an O2 analyzer Input section is not isolated. This feature is effective when an O2 analyzer is not built in.

* Externally installed O2 analyzer should be purchased separately.

Digital output: (Option)

1c contact (24V DC/1A, resistive load) max.15 outputs

Instrument error, calibration error, range identification, auto calibration status, solenoid valve drive for auto calibration, High/Low limit alarm contact output

* All relay contacts are isolated mutually and from the internal circuit.

Digital input: (Option)

Voltage contact (supply 12 to 24V DC (15mA max)) Max.9 inputs

Remote range change over, auto calibration remote start, remote hold, average value reset, Isolated from the internal circuit with photocoupler.

Power supply: Voltage rating ; 100V to 240V AC

> Allowable range ; 85V to 264V AC Frequency ; 50Hz/60Hz Power consumption ; 110VA max.

Operation conditions:

Ambient temperature;

-5°C to 45°C

(40°C max. when 2 optical systemat 200V AC power source)

; 90% RH max., Ambient humidity

non-condensing

Storage conditions:

Ambient temperature ; -20°C to 60°C ; 100% RH max., Ambient humidity

non-condensing

Dimensions (H × W × D):

133 x 483 x 382mm

13 kg max. Mass:

Finish color: Front panel; Cool gray (PANTON 1C-F)

Enclosure: Steel casing, for indoor use

Material of gas-contacting parts:

Gas inlet/outlet; SUS304

Sample cell; SUS304, chloroprene rubber Infrared-ray transmitting window; CaF2 Paramagnetic O₂ analyzer cell; SUS316 Fuel cell O2 analyzer cell; ABS resin Internal piping; Toaron, Teflon, Polypropylene

Solenoid valve; fluoro-rubber

Gas inlet/outlet: Rc1/4 or NPT1/4 internal thread Purge gas flow rate: 1L/min (when required) Life time of fuel cell O2 analyzer: 2 years

Standard Functions

Output signal holding:

Output signals are held unchanged during manual and auto calibrations by activation of holding (turning "ON" its setting). The values held are those just before start

calibration mode or setting value.

Usage is selectable.

Indication of instantaneous values will not

be held.

Switch ranges: The switch ranges function is available in

manual, auto, and remote modes. Only preset switch method is effective.

Manual: Allows range to switch by key operation. Auto:

Automatically switched from first range to second range when the measured value

exceeds 90%FS of first range.

Automatically switched from second range to first range when the measured value drops to 80% or less first range.

Remote: Voltage contact input

(Option)

Allows range to switch via an external signal when remote range switch input is

received.

When the contact input terminals for each component are input voltage, the first range is selected, and it is switched to the second range when the terminals are open.

* These switch range value are settable between the first range and second range values (low/high range values).

Optional Functions

Remote output holding:

Output signal is held at the last value or preset value by voltage input to the remote output holding input terminals.

Holding is maintained while is voltage input to the terminals. Indication of instantaneous values are not held.

Range identification signal:

The present measuring range is identified

by a contact position.

The contact output terminals close for each component when the first range is selected, and open when the second range

is selected.

Auto calibration:

Auto calibration is carried out periodically at the preset cycle.

When a standard gas cylinder for calibration and a solenoid valve for opening/ closing the gas flow line are prepared externally by the customer, calibration will be carried out with the solenoid valve drive contacts for zero calibration and each span calibration turned on/off sequentially at the set auto calibration timing.

Auto calibration cycle setting:

Auto calibration cycle is set.

Setting is variable within 1 to 99 hours (in increments of 1 hour) or 1 to 40 days (in increments of 1 day).

Gas flow time setting:

The time for flowing each calibration gas in auto calibration is set.

Settable within 60 to 900 seconds (in increments of 1 second)

Auto calibration remote start:

Auto calibration starts by opening the auto calibration remote start input terminal after short circuiting for 1.5 sec or longer.

Auto calibration starts when contacts open.

Auto zero calibration:

Auto zero calibration is carried out periodically at the preset cycle.

This cycle is independent from "Auto calibration" cycle.

When zero calibration gas and solenoid valve for opening/closing the calibration gas flow line are prepared externally by the customer, zero calibration will be carried out at the set auto zero calibration timing.

Auto zero calibration cycle setting:

Auto zero calibration cycle is set.

Setting is variable within 1 to 99 hours (in increments of 1 hour) or 1 to 40 days (in increments of 1 day)

Gas flow time setting:

The timing for flowing zero gas in auto zero calibration is set.

Settable within 60 to 900 seconds (in increments of 1 second)

High/low limit alarm:

Alarm contact output turns on when measurement value reaches the preset high or low limit alarm value.

Contacts close when the instantaneous value of each channel exceeds the high alarm limit value or falls below the low alarm limit value.

Instrument error contact output:

Contacts turn on at occurrence of analyzer error No. 1, 2, 3 or 10.

Calibration error contact output:

Contacts turn on at occurrence of manual or auto calibration error (any of errors No. 4 to 9).

Auto calibration status contact outputs:

Contacts turn on during auto calibration.

O₂ correction: Correction of measured NO, SO₂ and CO gas concentrations into values at refer-

ence O₂ concentration.

Correction formula:

$$C = \frac{21-On}{21-Os} \times Cs$$

C : Sample gas concentration after O₂ correction

Cs: Measured concentration of sample gas

 O_S : Measured O_2 concentration (Limit setting: 1 to 20% O_2)

On: Reference O₂ concentration (value changeable by setting.0 to 19% O₂)

Average value after O_2 correction and O_2 average value calculation:

The result of O_2 correction or instantaneous O_2 value can be output as an average value over the preset period of time.

Moving average method is used. Sampling interval is 30 secs.

(Output is updated every 30 seconds. Update is the averaged value of the most recently elapsed averaging time period.) Averaging time period is settable within 1 to 59 minutes (in increments of 1 minute) or 1 to 4 hours (in increments of 1 hour).

Average value resetting:

The above-mentioned output of average value is started from the initial state by opening the average value resetting input terminals after short circuiting for 1.5 sec or longer.

Output is reset by input voltage and restarted by opening the terminal circuit.

Communication function:

RS-485 (9pins D-sub connector)

Half-duplex bit serial Start-stop synchronization Modbus RTU™ protocol

Contents: Read/Write parameters

be used.

Read measurement concentration and instrument status.

Remark : When connecting via RS-

232C interface, an RS-232C ↔ RS-485 converter should

Atmospheric pressure correction:

Measure atmospheric pressure and calculate compensation (for use, be sure to relieve the exhaust gas from analyzer to the atmosphere)

After atmospheric pressure correction;

Zero point: No influenced

Span point: The change is 0.5% measured

value or less relating to the change of the atmospheric

pressure 1%.

Correction range: 700hPa-1050hPa

Performance

Repeatability: $\pm 0.5\%$ of full scale Linearity: $\pm 1\%$ of full scale

prior to atmospheric pressure correction

(option)

Zero drift: ±0.5% of full scale/week (measurable

component of NDIR)

±2.0% of full scale/week (O₂ analyzer)

Span drift: ±2.0% of full scale/week

Response time (T90):

30 seconds or better

Response interval may be changed depending on timing of the switching gas by sample switching operation. (Td=5-20

seconds)

Interference from other gases:

Sample switching design effectively minimizes interference. But it may occur depending on component gas and its

concentration.

Preprocessing can further decrease influ-

ence in this case.

Contact manufacturer for application

specific advice.

Requirements for Sample Gas

Flow rate: $1.0 \pm 0.2 L / min$ Temperature: $0 \text{ to } 50^{\circ}\text{C}$

Pressure: 10 kPa or less (Gas outlet side should be

open to the atmospheric air.)

Dust: 100 μg/Nm³ or less in particle size of 0.3

µm or smaller

Mist: Unallowable

Moisture: Less than 2°C saturation point. (Contain

comparable sample gas and reference

gas)

Corrosive component:

1 ppm or less

Standard gas for calibration:

1) For measurement with IR and/or built-in O_2 sensor

Zero gas ; Dry N₂

Span gas; Each sample gas having

concentration 90 to 100% of its measuring range (recom-

mended).

2) In case a zirconia O₂ analyzer is installed externally and calibration is carried out on the same calibration gas line:

Zero gas ; Dry air or atmospheric air (Do

not use with CO₂ measure-

ment)

Span gas $\,$; For other than $\,O_2$ measure-

ment, each sample gas having concentration 90 to 100% of its measuring range For O₂ measurement, O₂ gas of 1 to 2 vol%/remains N₂ gas

Reference gas for sample switching:

For sample gas dewpoint > 2° C sample switching reference gas is wet N_2 or at-

mospheric air.

For sample gas dewpoint < 2° C use dry N_2 or dry air. (Do not contain the component to be measured more than 0.1%FS of the

minimum measuring range.

Please refer to the "component eliminator" as discribed later and use the component eliminator to meet the above condition if

necessary.

If CO2 meter is used, do not use the at-

mosphere/Dry air.)

Purge gas: When base gas is H_2 and CO_2 meter is

under this condition that measuring range

is 100ppm or less,

Please purge the inside of the instrument.

Installation Requirements

- Indoor use (Select a place where the equipment does not receive direct sunlight, draft/rain or radiation from hot substances. If such a place cannot be found, a roof or cover should be prepared for protection.)
- · Avoid a place where unit receives heavy vibration.
- Select a place where atmospheric air is clean.

Principle diagram of NDIR type measurement (For NO, SO₂, CO₂, CO)

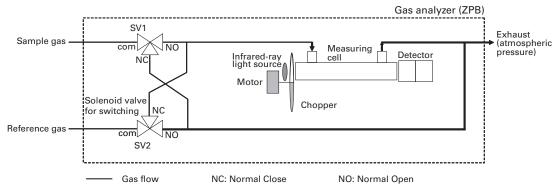

Principle diagram of fuel cell type measurment (For O₂)

Principle diagram of paramagnetic type measurment (For O₂)

Principle diagram of Sample switching method

Explanation of the sample switching method

Sample gas and reference gas are introduced alternately and constantly to the sample cell of the analyzer by Solenoid valve for switching flow (SV1,SV2)

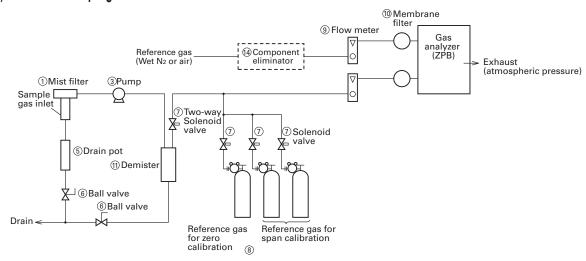

Solenoid valve SV1 and Solenoid valve SV2 are switched by the signal sent from the analyzer.

Analyzer measures each sample gas and each reference gas on proper timing and calculates the change of the sample gas and reference gas as the concentrate value (= gas concentration of the measurable component) and sends output signal.

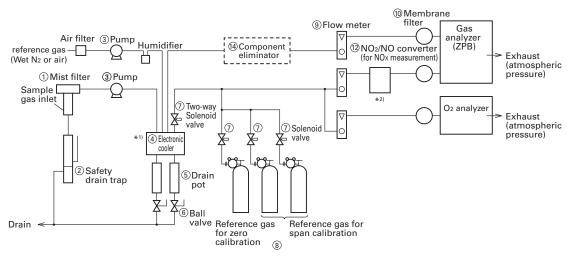

Due to monitoring the change of the sample gas and reference gas all the time, influence of the interference components and zero drift are eliminated.

Examples of sampling system configuration including gas analyzer

- * These are a typical configuration. As configuration might be different depending on measuring objects. Please consult with us.
- 1) To measure sample gas without moisture.

2) To measure high moisture content sample gas, NO, SO₂, or CO (saturation 2°C or more)

- *1) Be sure to remove the moisture to be temperature 5°C or lower from measuring gas by electronic cooler and water concentration should be equalized in sample gas and reference gas.
- *2) Be sure to use NO₂/NO converter in case of measuring NOx.

List of sampling devices (example)

No.	Device name	Fuji's type	No.	Device name	Fuji's type
1	Mist filter	ZBBK1V03-0	9	Flow meter	ZBD42203

Table 1 Measurable component and range - availability check table -

Procedure of range selection

On one component analyzer:

First determine 1st range, then select 2nd range from the corresponding right column.

More than two components:

The 2nd range in the tables for two and more components is maximum available range.

Select the 2nd range less than or equal to the "2nd range (max)".

0~25 vol%	V	0	0	0
0~50 vol%	Р		0	
0~100 vol%	R		0	

- note1)When "D" is specified at 4th digit, Power supply cord is supplied in the scope of supply. Cord specification should be specified at the 20th digit.
- note2)When "1"is specified at 7th digit, O_2 pt analyzer signal has to be set as 0-1V DC linear corresponding to full scale. External zirconia O_2 analyzer and external O_2 analyzer are not included in the scope of supply, and has to be separately ordered.
- note3)Select the range code for each range from the range code table shown above. Range of fuel cell O2 analyzer is 0-10vol% or more.
- note4)Select the type of voltage rating, plug type and applicable standard of the power supply cord by 20th digit. Select a power supply cord for using at the location of end-user.
- note5)O2 correction is calculated only for NO, SO2 and CO.
- note6)When 5 components measurement is specified, "H" must not be specified at 22nd digit. When 4 components measurement is specified and "H" is specified at 22nd digit, 3 points is maximum for alarm output function.
- note7)When "B" is specified at 24th digit, measuring range should be specified by ppm range code. In this case NO,SO₂ and CO measuring range are corresponding range in mg/m³. Please refer to the table shown below for the corresponding range code based on "mg/m³".
- note8)When "A"is specified at 25th digit ,the analyzer will be adjusted and delivered with the balance gas N₂. When other adjustment is required, please specify "Z". When "Z" is specified, please attach a list of gas composition contained in the measuring gas.

Corresponding mg/m³

Corresponding range in mg/m ³									
Range code	Unit : ppm	NO	SO ₂	CO					
А	0-50ppm	0-65.0mg/m ³	0-140mg/m ³	0-60.0mg/m ³					
В	0-100ppm	0-130mg/m ³	0-280mg/m ³	0-125mg/m ³					
С	0-200ppm	0-260mg/m ³	0-570mg/m ³	0-250mg/m ³					
D	0-250ppm	0-325mg/m ³	0-700mg/m ³	0-300mg/m ³					
S	0-300ppm	0-400mg/m ³	0-850mg/m ³	0-375mg/m ³					
E	0-500ppm	0-650mg/m ³	0-1,400mg/m ³	0-600mg/m ³					
F	0-1,000ppm	0-1,300mg/m ³	0-2,800mg/m ³	0-1,250mg/m ³					
G	0-2,000ppm	0-2,600mg/m ³	0-5,600mg/m ³	0-2,500mg/m ³					
U	0-2,500ppm	0-3,300mg/m ³	0-7,100mg/m ³	0-3,000mg/m ³					
Т	0-3,000ppm	0-4,000mg/m ³	0-8,500mg/m ³	0-3,750mg/m ³					
Н	0-5,000ppm	0-6,600mg/m ³	0-14.00g/m ³	0-6,250mg/m ³					

The conversion formula "ppm" unit into "mg/m³" unit. NO (mg/m³) = $1.34 \times$ NO (ppm) SO₂ (mg/m³) = $2.86 \times$ SO₂ (ppm) CO (mg/m³) = $1.25 \times$ CO (ppm)

SCOPE OF DELIVERY

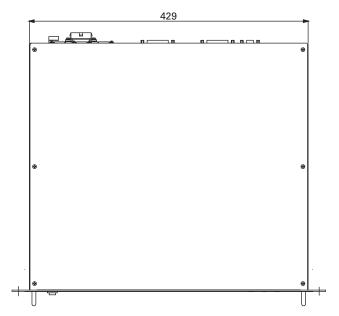

- Gas analyzer ... 1 unit
- Replacement fuse (250V, 2A AC, delay type) ... 2 pcs
- Instruction manual ... 1 copy
- Connector for I/O connection ... 1 set
- Power supply cord (standard inlet type 2m) ... 1 pc

ORDERING INFORMATION

- 1. Code symbols
- 2. Application and composition of sample gas

OUTLINE DIAGRAMS (Unit: mm)

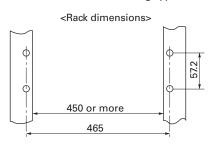

<TOP VIEW>

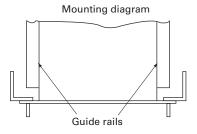

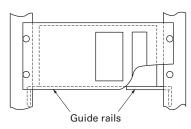

Mounting method

The analyzer weight should be supported at the bottom of the case.

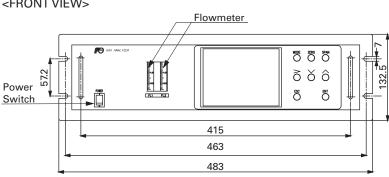

19-inch rack mounting type

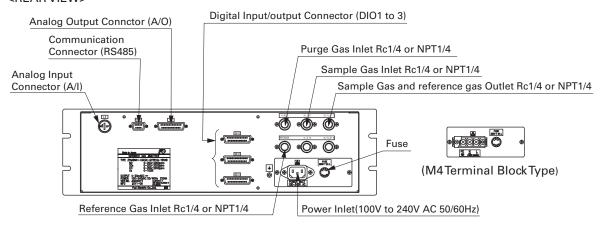

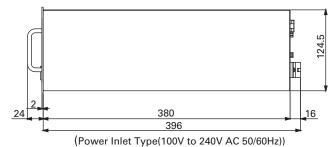

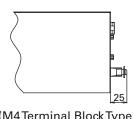

<REAR VIEW>

<SIDE VIEW>

(M4Terminal BlockType)

EXTERNAL CONNECTION

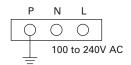

<Analog output> A/O connector

D-sub 25pins female

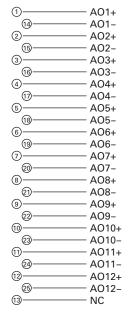

* In standard, displayed Channel No. and Analog Output No. are same.

<Terminal block>

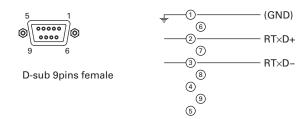

<Power inlet>

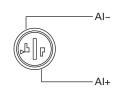

<RS485 communication signal>

<Analog input> A/I connector (O2 signal input)

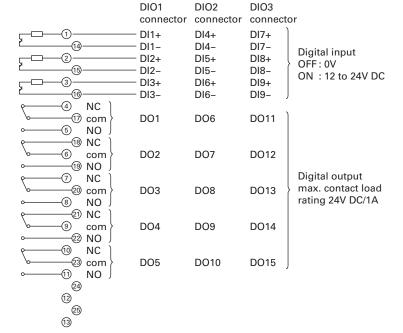

<Digital I/O> DIO 1 to 3 connector (option)

D-sub 25pins female

* DIO 1 to 3 are all as same connector.

Contents of digital input signal

The items in the parentheses may not be available depending on the selected type on 22th digit.

The normal open side (NO) of digital output is close when the function is active without range ID.

In case of range ID, normal open (NO) side is close with First-range.

The normal close (NC) side is close with Second-range.

Component eliminator (Item to be prepared separately)

<Note before ordering>

Whether or not you need the eliminator, it is depend on using gas as relative gas as follows.

Regarding specification of component eliminator, please refer to Fuji's data sheet DS3-1 "sampling device series for gas analyzer"

1. When you use the air as relative gas

Measuring	Code	Measurement component						
range		NO sensor	SO ₂ sensor	CO sensor	CO ₂ sensor			
0 - 50ppm	Α	0	0	0				
0 - 100	В	0	×	0				
0 - 200	С	×	×	0				
0 - 250	D	×	×	0				
0 - 300	S	×	×	0				
0 - 500	E	×	×	0				
0 - 1,000	F	×	×	0				
0 - 2,000	G	×	×	×				
0 - 2,500	U	×	×	×	○ (*5)			
0 - 3,000	Т	×	×	×	○ (3)			
0 - 5,000	Н	×	×	×				
0 - 1vol%	J							
0 - 2vol%	K							
0 - 3vol%	Q							
0 - 5vol%	L							
0 - 10vol%	M							
0 - 20vol%	N							
0 - 25vol%	V							

(*1) Whether or not you need the eliminator, it is all depending on concentration of component to be measured in relative gas.

If gas concentration to be measured in relative gas is <u>0.1% FS or less of the range</u>, component eliminator is not needed.

When concentration of the relative gas can not be comprehended correctly, please make sure to use the component eliminator as a general rule.

(*2) About above list

Above list is assumed that air is used as relative gas (except CO₂ sensor)

Since air contains CO gas approx.1.0ppm (*4), component eliminator is needed if gas concentration to be measured in relative gas of the CO sensor is 1.0ppm/0.1% FS=1,000ppm or less according to (*1)

Other measured component is same as shown on above list according to measurement authority in Tokyo.

- (*3) These are based on Tokyo public environment atmosphere measurement station and roadside automobile exhaust monitoring station.
- (*4) Since air contains CO₂ approx.400ppm, it is not recommended to use air as relative gas to measure CO₂. Please meet the requirements as shown (*1) such that using component eliminator after preparation of the lowest CO₂ concentration gas from available gas to be supplied continuously. Also, when measurement range is 100ppm or more, please use Fuji's inferred gas analyzer ZPA.
- (*5) When you specified several measurement components for ZPB, component eliminators are needed for each measured components.

However, one component eliminator can be used for both of No sensor and So₂ sensor.

2. When you use the N₂ as relative gas,

Whether or not you need the eliminator, it is all depending on concentration of component to be measured in relative gas. If gas concentration to be measured in relative gas is <u>0.1% FS or less of the range</u>, component eliminator is not needed. When concentration of the relative gas can not be comprehended correctly, please make sure to use the component eliminator as a general rule.

Exclusive Zirconia O2 Analyzer (to be purchased separately)

For O2 correction, the gas analyzer ZPB can accept linearized 0 to 1V DC signal from the O2 analyzer calibrated 0 to 25% O2 full scale. If the analyzer is not available, Fuji can supply exclusive Zirconia O2 analyzer Model ZFK. Measuring method:

Zirconia system

Measurable component and measuring range:

Measurable component		Range
O ₂	Oxygen	0 to 25vol%

Within ± 0.5% of full scale Repeatability: Within ± 1% of full scale Linearity: Zero drift: Within ± 1% of full scale/week Span drift: Within ± 2% of full scale/week

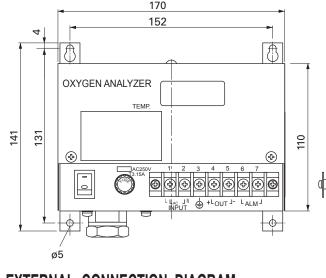

Response time: Approx. 20 seconds (for 90% response)

Measured gas flow rate:

 $0.5 \pm 0.25L / min$

Remark: The Zirconia system, due to its principle, may produce a measuring error due to relative concentration versus the combustible O2 gas concentration. Also, a corrosive gas (SO2 of 250 ppm or more, etc.) may affect the life of the analyzer.
